Abstract

The press section of a machine for making tissue paper has a drying cylinder (6), a central press roll (4), a shoe press unit (5), a press roll (3) which is in the form of a suction or fluted roll, and an endless felt (1) which passes through the press nip with the product web (2). A first nip is formed between the central press roll (4) and press roll (3), and a second is formed between the central press roll (4) and the shoe press unit (5). An additional device, for example a felt roll (8), is provided to guide the felt (1) from the central press roll (4) to a contact point with the drying roll (6).
